Risk-taking is a discontinuous function of the level of capital. A solution is derived for the liquidation rate in steady state and the determinants of charter value are investigated. Minimum capital standards are found to have little long-term impact on bank behaviour. Audit frequency is the principal tool for restraining moral hazard.

Banks with relatively low risk aversion will then choose relatively high leverage and relatively high asset risk. I would, thus, expect to observe a negative cross-sectional correlation between the level of asset risk and capital ratios due to cross-sectional variation in risk preferences. With respect to capital, exogenous shocks can be the result of unanticipated changes in earnings. With

THE IMPACT OF CAPITAL-BASED REGULATION ON BANK RISK-TAKING: A DYNAMIC MODEL I.

Introduction In this article, we consider the impact of increasingly stringent and complex bank capital regulation on the moral hazard problem attributed to federal deposit insurance. In recent years, in the wake of the savings and loan crisis in the U.S., more stringent and complex capital regulation has been
