What are dopamine receptor agonists? These medicines constitute a class of drugs used to treat Parkinson's disease (PD) symptoms that mimic the action of naturally occurring dopamine.

[Dopamine receptor - Wikipedia](#)

Dopamine receptors activate different effectors through not only G-protein coupling, but also signaling through different protein (dopamine receptor-interacting proteins) interactions. The neurotransmitter dopamine is the primary endogenous ligand for dopamine receptors.

The D1 receptor is the most abundant dopamine receptor in the brain. This receptor is linked to stimulatory G-proteins that activate adenylylate cyclase. The D1 receptors are found in high concentration in the substantia nigra pars reticulata, caudate, putamen, nucleus accumbens, olfactory tubercle, and frontal and temporal cortex. To date, the role of the D1-like receptors in psychiatric
