[Dynamic positioning - Wikipedia](#)

Dynamic positioning is a computer-controlled system to automatically maintain a vessel's position and heading by using its own propellers and thrusters. Position reference sensors, combined with wind sensors, motion sensors and gyrocompasses, provide information to the computer pertaining to the vessel's position and the magnitude and direction of environmental forces affecting its position. Examples of vessel types that employ DP include, but are not limited to, ships and semi-submersible mobile offshore drilling units. [Dynamic Positioning Of Large Tankers At Sea - OnePetro](#)

ABSTRACT In this paper, an unconventional dynamic positioning (DP) system is introduced which is relatively simple from the point of view of the thruster layout and, by virtue of the same thruster layout, automatically positions the vessel in a favorable heading relative to the environment.
