Electron Spectrum of Gapless Semiconductors presents the peculiarities of physical properties of a comparatively new class of solids – gapless semiconductors (GS). These peculiarities are determined by the main feature of the electron spectrum, namely the absence of a gap between the conduction and valence bands. GSs form a boundary between metals and semiconductors. On the other hand GSs are of practical interest since they are very sensitive to impurities, and to the influence of light.

Gapless semiconductors: A new class of materials Abstract. The properties of gapless semiconductors, which are characterized by the absence of a gap between the conduction and valence bands and therefore by an extremely high sensitivity to external influences, are examined. In particular, attention is given to the electron spectrum of pure gapless semiconductors.
