[Electron Transport Chain | Biology for Majors I](#)

The electron transport chain is a series of electron transporters embedded in the inner mitochondrial membrane that shuttles electrons from NADH and FADH₂ to molecular oxygen. In the process, protons are pumped from the mitochondrial matrix to the intermembrane space, and oxygen is reduced to form water.

[Electron transport chain - Wikipedia](#)

An electron transport chain (ETC) is a series of complexes that transfer electrons from electron donors to electron acceptors via redox (both reduction and oxidation occurring simultaneously) reactions, and couples this electron transfer with the transfer of protons (H⁺ ions) across a membrane.

[Electron Transport Chain and Energy Production - ThoughtCo](#)

The electron transport chain is where most energy cells are generated. This "chain" is actually a series of protein complexes and electron carrier molecules within the inner membrane of cell mitochondria, also known as the cell's powerhouse.

Initiation of Electron Transport Chain: Once the NADH has been made from a metabolite in the citric acid cycle inside of the mitochondria, it interacts with the first complex 1 enzyme, known as NADH reductase.

Electron transport chain (video) | Khan Academy

After being done with glycolysis and the Krebs Cycle, we're left with 10 NADHs and 2 FADH₂s. And I told you that these are going to be used in the electron transport chain. And they're all sitting in the matrix of our mitochondria. And I said they're going to be used in the electron transport chain
