 Qualitative behavior: Elliptic equations have no real characteristic curves, curves along which it is not possible to eliminate at least one second derivative of from the conditions of the Cauchy problem. Since characteristic curves are the only curves along which solutions to partial differential equations with smooth parameters can

#### Elliptic operator - Wikipedia

In the theory of partial differential equations, elliptic operators are differential operators that generalize the Laplace operator. They are defined by the condition that the coefficients of the highest-order derivatives be positive, which implies the key property that the principal symbol is invertible, or equivalently that there are no real **Elliptic partial differential equation - Encyclopedia of ...**

A partial differential equation is said to be of elliptic type in its domain of definition if it is elliptic at every point of this domain. An elliptic partial differential is called uniformly elliptic if there are positive numbers and such that
