0A What are syzygies? In algebraic geometry over a field K we study the geometry of varieties through properties of the polynomial ring $S = K[x_0, \dots, x_n]$ and its ideals. It turns out that to study ideals effectively we also need to study more general graded modules over S . The simplest way to describe a module is by generators and relations. We may think of a set M of generators for

We first prove the graded mapping cone theorem on partial eliminations as a general algebraic tool to study syzygies of the non-complete embedding of X . For applications, we give an optimal bound on the length of zero-dimensional intersections of X and a linear space L in terms of graded Betti numbers.

Since this idea was first used in the graded setting in [12] our wish is to compare and contrast the way in which the weak order ideal property can be used to deduce the Syzygy Theorem in the two contexts: (1) for syzygies of modules over standard graded rings over a DVR; (2) for k th syzygies of modules over a local hypersurface ring satisfying $S_k \ll 472$ P. The morphism $\pi: P \rightarrow 0$ is S -graded if one gives degree n to the variable X_n . Moreover, one has a minimal S -graded free resolution for R . The problem of computing the syzygies for R and, in particular, of giving a minimal system of generators of L , has been treated extensively. The classical way to perform this (in a more general context) is to use elimination theory and I Research by both authors is
