[Outer Membrane Vesicles \(OMVs\) of Gram-negative Bacteria ...](#)

Outer Membrane Vesicles. Outer Membrane Vesicles are small, spherically bilayered (100-300 nm) vesicles released into extracellular milieu from the OM of Gram-negative bacteria (Beveridge, 1999).

[Functions of Secreted Bacterial Outer Membrane Vesicles](#)

Gram-negative bacteria produce outer membrane vesicles (OMVs) that contain biologically active proteins and perform diverse biological processes. Unlike other secretion mechanisms, OMVs enable bacteria to secrete insoluble molecules in addition to and in complex with soluble material.

[Bacterial outer membrane vesicles and the host pathogen ...](#)

By virtue of their small size, adhesive properties, endotoxic component, and ability to carry and deliver toxic components into host cells, outer membrane vesicles are likely to play a significant role in disseminating virulence factors for Gram-negative pathogens.

[Outer membrane vesicles as platform vaccine technology](#)

Outer membrane vesicles (OMVs) are released spontaneously during growth by many Gram negative bacteria. They present a range of surface antigens in a native conformation and have natural properties like immunogenicity, self adjuvation and uptake by immune cells which make them attractive for application as vaccines against pathogenic bacteria.

Gram-negative bacteria release outer membrane vesicles (OMVs) into the extracellular environment. OMVs have been studied extensively in bacterial pathogens, however [Isolation of Outer Membrane Vesicles from Phytopathogenic ...](#)

Extracellular vesicle (EV) release is a process shared by many organisms from all domains of life. In Gram-negative bacteria, most EVs are a result of the outer membrane blebbing and eventually pinching off the bacterial cell wall, and are hence referred to as outer membrane vesicles (OMVs).
