Protein kinase C - Wikipedia

Protein kinase C, commonly abbreviated to PKC (EC 2.7.11.13), is a family of protein kinase enzymes that are involved in controlling the function of other proteins through the phosphorylation of hydroxyl groups of serine and threonine amino acid residues on these proteins, or a member of this family.

Protein Kinase C - an overview | ScienceDirect Topics
Protein Kinase C. Protein Kinase C (PKC) is a family of serine threonine kinases found in most cell types whose activity has a strong influence on a wide variety of signal transduction events.

Protein Kinase C: Structure, Function, and Regulation
INTRODUCTION. The protein kinase C family of enzymes transduces the myriad of signals promoting lipid hydrolysis. The prevalence of this enzyme family in signaling is exemplified by the diverse transduction mechanisms that result in the generation of protein kinase C's activator, diacylglycerol.

Protein kinase C zeta type - Wikipedia

Protein kinase C, zeta (PKC ζ), also known as PRKCZ, is a protein that in humans is encoded by the PRKCZ gene. The PRKCZ gene encodes at least two alternative transcripts, the full-length PKC and an N-terminal truncated form PKM.

Protein Kinases - an overview | ScienceDirect Topics
Protein Kinases. Protein kinases (PTKs) are enzymes that regulate the biological activity of proteins by phosphorylation of specific amino acids with ATP as the source of phosphate, thereby inducing a conformational change from an inactive to an active form of the protein.

The kinase dendrograms (above) show the sequence similarity between these catalytic domains: the distance along the branches between two kinases is proportional to the divergence between their sequences. Seven major groups are labeled and colored distinctly. For instance, the tyrosine kinases form a distinct group, whose members phosphorylate proteins on tyrosine residues, whereas enzymes in
