Minimization presents and analyzes a unifying framework
for a wide variety of numerical methods in optimization.

The author's 'reduce-or-retreat' framework is a conceptual
method-outline that covers any method whose iterations
choose between reducing the objective in some way at a
trial point, or retreating to a closer set of trial points. The
alignment of various derivative-based methods within the
same framework encourages the construction

follows from Proposition 14 after we show that the iterate-
sets X_k are eventually contained in B_δ and the result
will follow since we always have $X_k \text{ lev } f \text{ max}_k f$ by the
definition of $f \text{ max}_k$.
