The auditory cortex makes sense of information that has been sent to it along auditory pathways from the ear. Human speech would be unintelligible without the auditory cortex. The many different parts of the human brain all work together to ensure that a person can detect and process all speech, music, and sounds with all of their subtleties.

The ultimate target of afferent auditory information is the auditory cortex. Although the auditory cortex has a number of subdivisions, a broad distinction can be made between a primary area and peripheral, or belt, areas. The primary auditory cortex (A1) is located on the superior temporal gyrus in the temporal lobe and receives point-to-point

Invasive recordings in the human auditory cortex ...

Electrodes used for invasive studies of human auditory cortex are either implanted to penetrate cortical gray matter (depth electrodes) or placed over the cortical surface (surface arrays).
