One compelling argument for the moon landing hoax is the total lack of stars in any of the photographic/video evidence. There are no clouds on the moon, so stars are perpetually visible and significantly brighter than what we see through the filter of Earth's atmosphere.

What would happen if the Moon wasn't there? |

Physics Forums

Solar tide is less than half of lunar tide, but still considerable. However, without a moon the seas would be a lot quieter. This would probably lessen the mixing of cold and warm water and therefore of nutrients. If the moon would explode, its center of gravity would be unaltered.

Can moons have moons? (Intermediate) - Curious About ...

The Moon, like almost all other moons in the solar system, is in synchronous rotation about the Earth meaning it shows the same face to Earth at all times (its rotation period about its own axis is the same as its orbital period about the Earth), which is a result of tidal forces between the Earth and Moon.

How to Tell Whether the Moon Is Waxing or Waning - wikiHow

To tell whether the moon is waxing or waning, you'll first need to factor in whether you live in the Northern or Southern Hemisphere, since the moon's phases don't look the same from both places. If you're in the Northern Hemisphere, the moon waxes and wanes from right to left, meaning a waxing moon is illuminated on the right side, and a waning moon is illuminated on the left side.

Moon Facts: Fun Information About the Earth's Moon | Space

The moon is the easiest celestial object to find in the night sky when it's there. Earth's only natural satellite hovers above us bright and round until it seemingly disappears for a few nights.

Moon - Wikipedia

The Moon is an astronomical body that orbits planet Earth and is Earth's only permanent natural satellite. It is the fifth-largest natural satellite in the Solar System, and the largest among planetary satellites relative to the size of the planet that it orbits (its primary).

Lunar phase - Wikipedia

The lunar phase or phase of the Moon is the shape of the directly sunlit portion of the Moon as viewed from Earth. The lunar phases gradually and cyclically change over the period of a synodic month (about 29.53 days), as the orbital positions of the Moon around Earth and of Earth around the Sun shift.
